

POS SYSTEM — Pitching Script

Word-by-word script for presenting the POS system to investors, partners, or supermarket owners

Estimated time: 12–15 minutes | 12 slides

SLIDE 1: Opening

Slide: Cover — POS System

"Good [morning/afternoon], everyone. Thank you for your time today.

My name is [Your Name], and I'm here to show you something that will change how supermarkets operate in Kenya.

*Let me ask you a quick question — **how many of you have stood in a supermarket queue, watching the cashier write things down by hand, or fumble with a calculator?***

[pause for hands]

That's exactly the problem we've solved."

Tip: Make eye contact during the question. This engages the audience immediately.

SLIDE 2: The Problem

Slide: The Problem

"Right now, thousands of supermarkets across Kenya are running on paper, spreadsheets, or outdated systems that weren't built for this market.

The consequences are real:

First — manual processes. *Handwritten receipts. Manual stock counts. When was the last time you saw a shopkeeper counting rice by hand? That's not efficiency. That's time and money walking out the door.*

Second — zero real-time visibility. *A supermarket owner has no idea what's selling, what's running low, or how much cash is in the register — until the end of the day. By then, it's too late.*

Third — payment friction. *Kenya leads the world in mobile money. 73% of our GDP flows through M-Pesa. But most POS systems treat it as an afterthought — an expensive add-on, not a core feature.*

*And the numbers tell the story: **Kenya loses an estimated 2.5 billion shillings annually** to inventory shrinkage and poor stock management alone."*

SLIDE 3: The Solution

Slide: Our Solution

"So what did we build?"

*We built a **complete, modern point-of-sale system designed specifically for Kenyan supermarkets.***

Let me walk you through what makes it different:

Barcode scanning — you point the scanner, the product pops up instantly. No typing, no errors. The cashier just scans and goes.

M-Pesa STK Push — the customer enters their phone number, the payment prompt appears on their phone, they enter their PIN, and the system confirms in seconds. No separate M-Pesa machine needed.

Real-time inventory — the moment a product is scanned and sold, the stock level updates. You always know what you have.

Cash management — every shilling is tracked. Opening float, cash in, cash out, expenses — all recorded automatically.

And here's what's critical for us: **it's built for Kenya from day one.** KES currency. 16% VAT. KRA compliant. M-Pesa native. This isn't an imported system we're retrofitting — it was born here."

SLIDE 4: Key Features

Slide: Key Features (dark slide)

"Let me show you the eight pillars of this system:

One — POS Terminal. Barcode scanner integration with auto-focus. The input is always ready. Scan and go.

Two — Inventory. Stock tracking, low-stock alerts with amber warnings, inter-branch transfers, damage logging. Everything moves with the product.

Three — Cash Management. Every till session is tracked. Cashiers open with a float, the system records every sale, every cash in, every cash out. End-of-day reconciliation takes minutes, not hours.

Four — Reports. Department-level reports. Sales analytics. Top products. And every report is printable with one click.

Five — Customers. Built-in loyalty program. Bronze, Silver, Gold tiers. Points earned and redeemed automatically.

Six — M-Pesa. Native STK Push integration. Not an add-on. Built into the payment flow from the start.

Seven — Security. Role-based access. Every user logs in with a PIN. Every action is audited.

Eight — Desktop App. Electron packaging means it runs as a native desktop app on Windows, Mac, or Linux."

SLIDE 5: Technical Architecture

Slide: Technical Architecture

"Now let me give you a quick look under the hood — but don't worry, I'll keep it simple.

The backend runs on **NestJS**, one of the most robust Node.js frameworks. It has 15 modular controllers and over 60 API endpoints. Every feature — sales, inventory, customers, payments — is its own module. Clean, maintainable, scalable.

The database is **PostgreSQL** — the same database used by banks and governments worldwide. We have 30+ relational tables with full ACID compliance. Your data is safe.

The frontend is **React** with **Tailwind CSS** — a modern, responsive interface.

And it's wrapped in **Electron**, so it runs as a desktop application, not just a website.

And the most important architectural decision: **it works offline**. If the internet goes down — and in Kenya, it will — the system keeps running. Sales are recorded locally and synced when the connection returns. You never lose a sale."

SLIDE 6: API & Database

Slide: API Endpoints / Database Schema

"Let me put some numbers to this.

We have **over 60 REST API endpoints** across 14 modules. Auth, Products, Sales, Payments, Customers, Inventory, Cash, Reports, Settings, Promotions, Sync, Employees, Suppliers, and Audit.

Every endpoint is documented with Swagger — that's the industry standard for API documentation. A developer can understand and integrate with this system in hours, not weeks.

On the database side, we have **30+ tables** covering every aspect of supermarket operations. From products and variants, to sales and payments, to loyalty transactions and sales forecasts. It's a complete data model.

And here's what matters for compliance: **every transaction is immutable**. Once a sale is recorded, it cannot be altered. That's KRA eTIMS ready."

SLIDE 7: User Roles

Slide: User Roles & Permissions

"Security is not optional. This system has **four distinct user roles** with granular permissions:

Super Admin — full access to everything. Can manage users, view all reports, and configure the system.

Branch Manager — can process refunds, view reports, manage inventory, but cannot delete users.

Cashier — can create sales, process payments, and view products. That's it. No access to reports or inventory adjustments.

Inventory Clerk — can manage stock levels, adjust quantities, and transfer between terminals. No access to sales or cash.

Every login requires a **4-digit PIN**. Every action generates an **audit log**. If something goes missing, you'll know who was logged in and what they did.

This is how you prevent internal theft — the #1 cause of retail shrinkage."

SLIDE 8: M-Pesa Integration

Slide: M-Pesa Integration

"Now, let's talk about the feature that matters most in this market: **M-Pesa**.

We use the **Lipa Na M-Pesa STK Push** API. Here's how it works in practice:

The cashier scans all the items. The total comes up. The customer says 'I'll pay with M-Pesa.' The cashier selects M-Pesa, enters the customer's phone number, and presses pay.

Instantly, the customer's phone buzzes. The M-Pesa prompt appears. They enter their PIN. Done.

Within seconds, our system receives the callback confirming the payment. The sale is recorded, the stock is updated, and the receipt is ready.

No separate Safaricom device. No manual confirmation codes. No waiting.

This is how 33 million M-Pesa users expect to pay. And this is how our system handles it."

SLIDE 9: Competitive Advantage

Slide: Why Choose Us

"So why should you choose this system over the alternatives?"

Let's be honest about the three options in the market today:

Option one: imported POS systems — SAP, Oracle Retail, Lightspeed. They're powerful, but they cost thousands of dollars per year. They're designed for Western markets. M-Pesa is an afterthought. And if you need customization, you're calling a support line in another country.

Option two: generic POS apps — Square, Shopify, Toast. Again, not built for Kenya. No M-Pesa. No KES. No KRA compliance. You'd spend more time configuring than using.

Option three: paper and calculator. Still the most common in Kenya. No data. No reports. No accountability.

Our system is **built for Kenya, priced for Kenya, and designed for how Kenyans actually shop and pay.**

M-Pesa native. Offline-capable. KRA compliant. And it costs a fraction of imported solutions."

SLIDE 10: Market Opportunity

Slide: Market Opportunity (dark slide)

"Let me give you the market numbers.

*There are **over 12,000 supermarkets in Kenya** alone. The annual retail market is worth over **2.5 trillion shillings.***

*73% of all payments are now made through M-Pesa. And here's the key stat: **roughly 40% of supermarkets still use manual or outdated systems.***

That's nearly 5,000 supermarkets that need what we've built.

Our target customers include the big chains — Naivas, Carrefour, Quickmart — but more importantly, the thousands of independent supermarkets and wholesale-retail hybrid stores that can't afford enterprise solutions but desperately need modern tools.

Our expansion plan is simple:

Phase 1: Kenya — Nairobi and major towns

Phase 2: East African Community — Uganda, Tanzania, Rwanda

Phase 3: West Africa — Nigeria, Ghana

*And the business model? **SaaS subscriptions.** Predictable, recurring revenue. Every supermarket, every month."*

SLIDE 11: Live Demo

Note: If doing a live demo, switch to the running application at this point. If not, skip to Slide 12.

"Let me show you how this actually works. I'll log in as a cashier — Daniel Ochieng, PIN 1111.

[pause — login]

You can see the dashboard — today's sales, transactions, low stock alerts. Everything at a glance.

Let me go to the POS Terminal. I'll scan a barcode now.

[scan barcode]

See that? Instant product lookup. Name, price, stock — all displayed. It's added to the cart automatically.

I'll scan a few more items. Each one, instant. No typing. No searching.

Now let's check out. Total is on the right. I'll select Cash. Complete Sale.

Done. The sale is recorded. Stock is updated. Ready for the next customer.

That's the speed your cashiers will operate at."

SLIDE 12: Closing

 Slide: Closing — Ready to Transform

"So let me bring this together.

*We've built a **complete point-of-sale system** that:*

- ✔ Processes sales in under 3 seconds with barcode scanning*
- ✔ Handles M-Pesa, Cash, and Card payments natively*
- ✔ Tracks every item in your inventory in real-time*
- ✔ Generates printable department reports with one click*
- ✔ Manages cash sessions and expenses automatically*
- ✔ Runs offline — no internet, no problem*
- ✔ Secures your business with role-based access and audit logs*
- ✔ Costs a fraction of imported alternatives*

The code is open and documented. The system is live and running. The market is ready.

The question is: are you ready to transform your supermarket?

Thank you. I'm happy to take any questions."

APPENDIX: Quick Reference

Demo Accounts

Username	PIN	Role
admin	1234	Super Admin
manager	5678	Branch Manager
cashier	1111	Cashier
cashier2	2222	Cashier

inventory

3333

Inventory Clerk

Sample Barcodes for Demo

Barcode	Product	Price (KES)
6161100100011	Fresh Milk 500ml	85
6161100300028	Coca-Cola 500ml	80
6161100600011	White Bread 400g	65
6161100700011	Pishori Rice 2kg	350
6161100400011	Simba Chips 100g	120

Handling Objections

Objection	Response
"It's too expensive"	Our SaaS model starts at a fraction of imported systems. One month's savings on inventory shrinkage covers a year of subscription.
"What if internet goes down?"	The system runs offline. Sales are cached locally and sync automatically when the connection returns. You never lose a sale.
"We already have a system"	We can migrate your existing data. Most transitions take less than a week. And you'll get M-Pesa, reports, and inventory tracking you don't have today.
"Is my data secure?"	PostgreSQL with full encryption. Role-based access. Audit logs on every action. JWT authentication. Your data is bank-grade secure.
